BatchFence

Evidence-backed lot containment

Web and Windows

Project presentation
18 October 2026

Which stock should we hold now?

A revised supplier notice

Changes which lots the incident includes

Incomplete receiving records

Leave some finished stock uncertain

An approval tied to old evidence

Cannot authorize the revised decision

BatchFence | Revised supplier boundary

FICTIONAL ENGINEERING SOURCE – no real inventory

Supplier bulletin GA-RH, revision 3, 10 October 2025

This bulletin supersedes the earlier supplier boundary for this case.

Complete the case boundary: this is the exhaustive affected supplier list.

Affected lots: SUP-C, SUP-A

SUP-C is affected by the confirmed coating defect.

SUP-A remains affected by the same confirmed coating defect.

SUP-B is explicitly excluded from this notice.

Every listed supplier identity is confirmed. No other supplier lots are affected.

No inventory action or release is authorized. Review and approval remain separate.

Fictional engineering scenario. The original document remains available for review.

The incident workflow

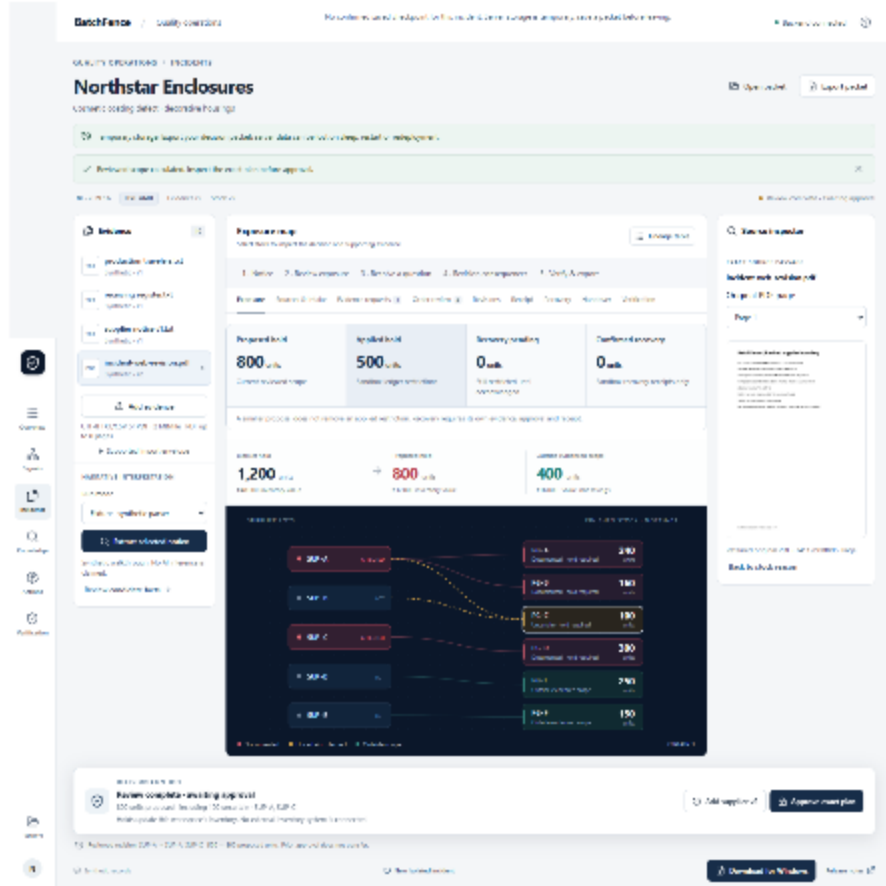

01 Retain original evidence

02 Inspect model proposals

03 **Review lots and scope**

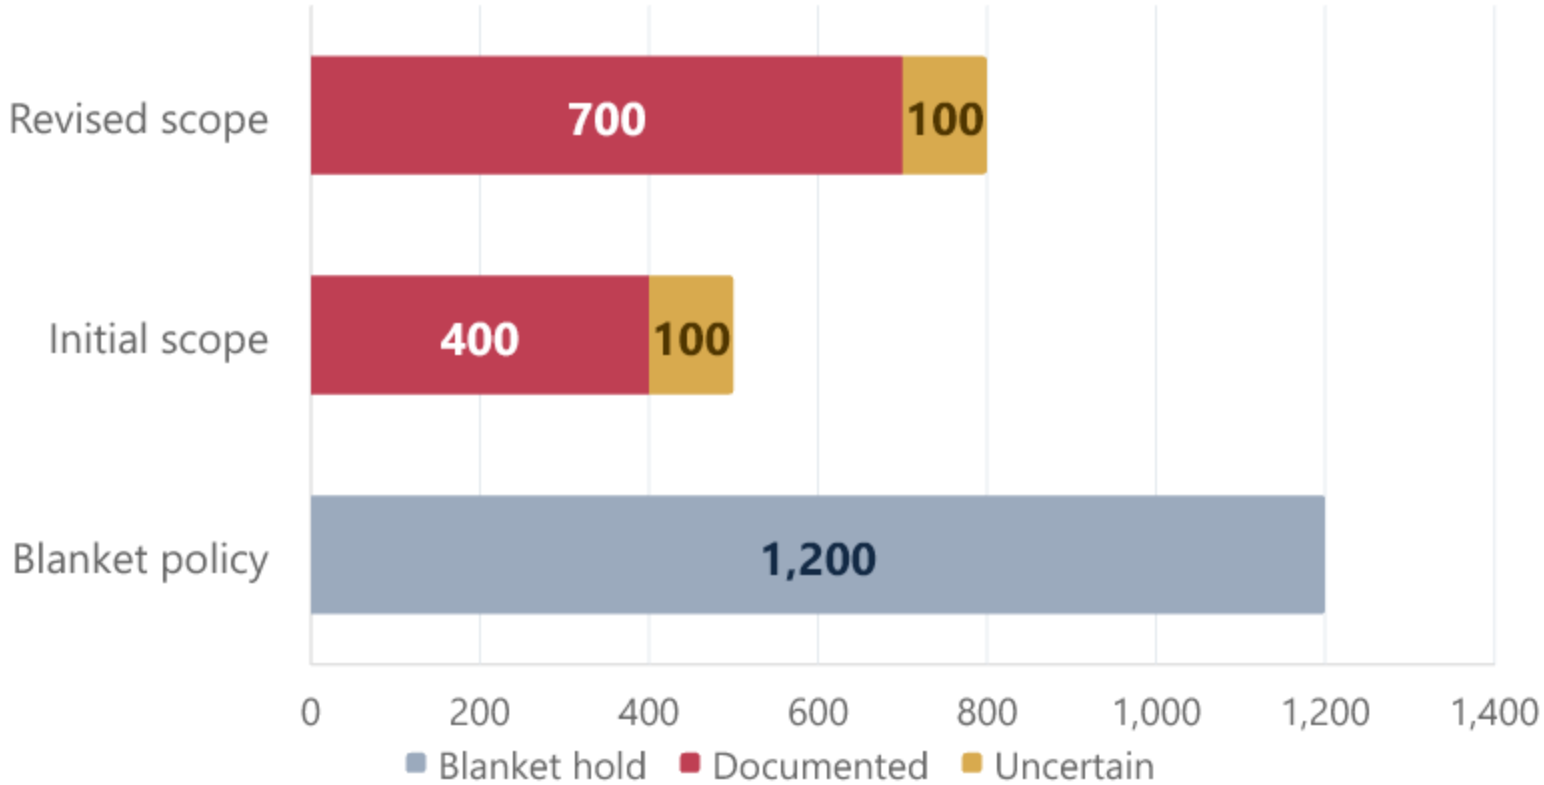

04 Approve the calculated plan

05 Apply sandbox holds and export

Original evidence, reviewed facts and approved actions retain separate authority.

The supplier revision changes the hold

800

units in the revised scope

100 uncertain units remain included

Synthetic inventory scenario. Fresh revised PDFs drove the 800-unit result after explicit review.

A smaller proposal does not release a hold

Decision state	Proposed	Applied	Required authority
Initial approval	500	500	Containment receipt
Supplier revision	800	500	New exact approval
Revised approval	800	800	Second receipt
Receiving correction	700	800	Separate recovery review
Recovery approval	700	700	Recovery receipt

Units. Containment and recovery are separate decisions. The recovery rows show a preserved synthetic scenario.

Missing lot identities stay unresolved

Historical model proposal

SUP-A affected

Complete scope claimed

Application review proposal

SUP-A affected
SUP-B uncertain
SUP-C uncertain

Unknown scope

Historical omission replay. Missing evidence cannot justify an exclusion or a narrowed approval.

AMD and Evolus in the workflow

Component	Responsibility	Authority
Evolus document reader	Read the retained original PDF	Unreviewed source output
Extractor and Gemma agent	Propose identities and incident labels	Unreviewed proposals
BatchFence review engine	Check sources and calculate scope	Reviewed evidence
Explicit approval and ledger	Bind exact actions and retain receipts	Sandbox actions only

Configured own/gemma-4-31b-it on managed AMD access. Evolus does not expose runtime model identity.

RAG cites the complete approved original

“Before release or recovery, recorded receiving evidence must resolve the relevant ancestry and the applicable quality condition. A separate authorized approver is required. A source citation, model answer or narrower proposed hold never releases existing applied holds.”

SOP-FOCUSED-EN
Revision 1
Recovery passage

Exact source hash
Identified remote chunks
Full original caveat

Application-verified indexed sources. Provider-native citation annotations remain empty.

Connected quality workflows

Quality signals

Review patterns without creating incidents automatically

Approved knowledge

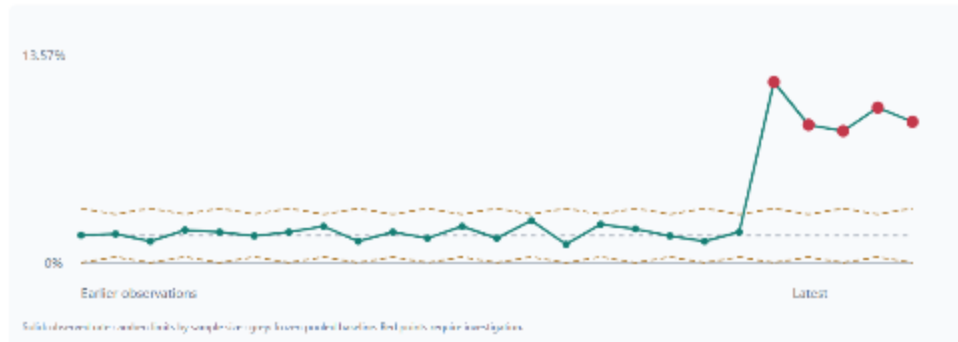

Consult versioned procedures in source context

Controlled recovery

Separate release evidence and approval

Corrective action

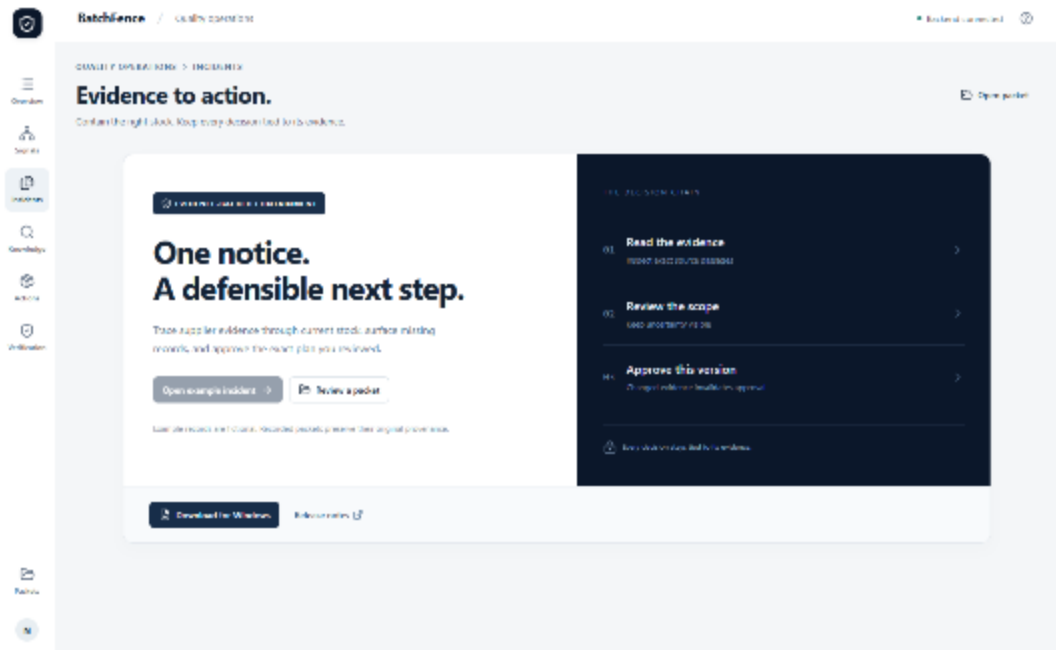

Review effectiveness against recorded outcomes

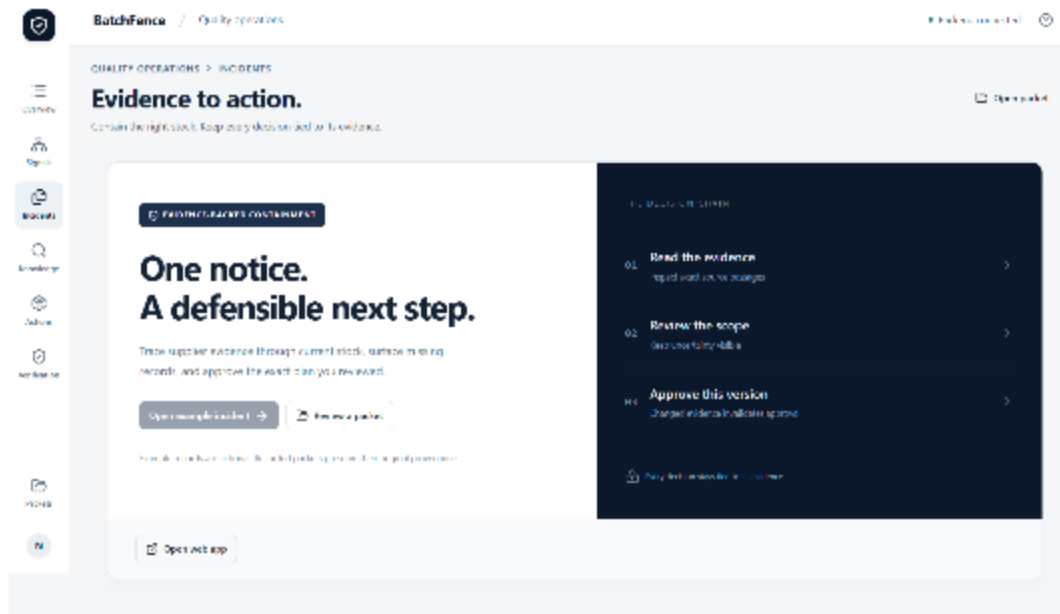

Synthetic signal panel: v0.3.0 engineering evidence. Current release preserves these workflows.

One workbench on web and Windows

Public web application

Installed Windows client

Shared source review and approval controls. Exported packets reopen as historical, read-only evidence.

Verification evidence

491

passing regression tests

30

deterministic domain scenarios

Fresh PDF and Evolus RAG processing in both clients

Two receipts retained. Stale approval rejected.
Five release assets verified. Public and installed bytes match.

Agent-operated engineering with fictional records. Independent human acceptance remains pending.

Release boundaries

Review still matters

Metadata format errors remain visible and require original review

Citation provenance stays explicit

The application verifies sources while native annotations remain absent

Deployment has practical limits

Unsigned installer, temporary hosted storage and pending independent acceptance

A new live demo needs a current allowance

The engineering evaluation is complete at 18 of 18 reserved equivalents

Verified for a controlled hackathon demonstration. Production enterprise readiness remains unestablished.
